Troubleshooting and Service**

WHY ACURA TRAK?

Implement "Tail-Out" is eliminated by lengthening and shortening the 3-point lift arms of the tractor. This is accomplished by movement of the Acura Trak crank arms as the tractor moves from the center of the row. Thus, the tool bar, when properly stabilized, is always 90 degrees to the row and the working tools are centered.

Sunco Stabilizer

The Sunco Stabilizer is built strong and designed for versatile mounting on a wide variety of implements. The unique torsion spring provides positive stabilization in uneven ground and protection where rocky conditions exist. Easy height adjustment and a variety of brackets makes use on most implements possible.

PROPER IMPLEMENT STABILIZATION IS A MUST. The implement must remain perpendicular to the rows and centered between them. When the implement is properly stabilized, the Acura Trak will prevent Implement "Tail-Out" from occurring.

Pays for Itself Plus Puts Money in Your Pocket

ACURA TRAK ELIMINATES TAIL-OUT TRACTOR TURNING LEFT

ACURA TRAK ENHANCES GPS STEERING SYSTEMS

When the tractor is required to make steering adjustments, the implement cannot remain perpendicular to the rows. By stabilizing the implement and using an Acura Trak, the tractor is allowed to turn left or right while leaving the implement perfectly perpendicular to and centered in the rows.

OPTIONS AVAILABLE FOR ACURA TRAK MODEL T/T

Sunco Crop Sensing Wands

Universal crop sensing wands can be set to sense off one or two rows. This gives the Acura Trak excellent performance in both small and large crops and trashy conditions.

Mark Guide Weights

The marker guide weights are used to follow the planter or bedder marker furrow. This option will not only help you have straight rows, but will give you accurate guess rows.

Furrow Guide Weights

Furrow guide weights are used to sense the location of the ridge or bed to keep your planter on top and in the center.

External Sensor Kit

External sensor mount bracket with 17-foot remote sensor cable extension allows you to remotely locate your sensors for better visibility and to clear obstructions such as PTO shafts, pumps and drawbars.
